■ ESKF模型

状态量:
$$x = \begin{bmatrix} q \\ w_b \end{bmatrix}$$

Ture-state:

nominal-state:

$$\begin{cases} \dot{q}_{t} = \frac{1}{2} q_{t} \otimes (w_{m} - w_{bt} - w_{n}) \\ \dot{w}_{bt} = w_{bn} \end{cases}$$
 (140)
$$\begin{cases} \dot{q} = \frac{1}{2} q \otimes (w_{m} - w_{b}) \\ \dot{w}_{b} = 0 \end{cases}$$
 (142)

$$\mathfrak{P}: \quad q_t = q \otimes \delta q \qquad \delta q \approx \begin{bmatrix} 1 \\ \delta \theta / 2 \end{bmatrix} \qquad w_{bt} = w_b + \delta w_b \qquad (Table 2)$$

得到误差状态error-state的运动模型微分形式:

$$\begin{cases}
\delta \theta = -[w_m - w_b]_{\times} \cdot \delta \theta - \delta w_b - w_n \\
\dot{\delta w_b} = w_{bn}
\end{cases} (143)$$

得到误差状态的运动模型递推表达式:

$$\begin{cases} \delta\theta \leftarrow R\{(w_m - w_b)\Delta t\}^T \cdot \delta\theta - \delta w_b \cdot \Delta t - \theta_i \\ \delta w_b \leftarrow \delta w_b + w_i \end{cases}$$
 (166)

其中:

$$\begin{cases} (w_m - w_b)\Delta t \triangleq u\Delta\theta \\ R\{(w_m - w_b)\}^T = R\{-u\Delta\theta\} = I - [u]_{\times} \sin\Delta\theta + [u]_{\times}^2 (1 - \cos\Delta\theta) \end{cases}$$

其中 θ_i w_i 为高斯随机脉冲噪声,均值为0,协方差为 w_n w_{bn} 在 Δt 时间内的积分值

$$\left\{ \begin{array}{l} \Theta_i = \sigma_{w_n}^2 \Delta t^2 I \\ \Omega_i = \sigma_{w_{hn}}^2 \Delta t^2 I \end{array} \right.$$

■ ESKF预测方程

$$\left\{\begin{array}{l} \overset{\wedge}{\delta x} \leftarrow F_x \cdot \overset{\wedge}{\delta x} \\ P \leftarrow F_x P F_x^T + F_i Q_i F_x^T \end{array}\right.$$

对状态变量求偏导:

$$F_{x} = \begin{bmatrix} R\{(w_{m} - w_{b}) \cdot \Delta t\}^{T} & -I \cdot \Delta t \\ 0 & I \end{bmatrix}$$

对噪声变量求偏导:

$$F_i = \begin{bmatrix} I & 0 \\ 0 & I \end{bmatrix} \qquad Q_i = \begin{bmatrix} \Theta_i & 0 \\ 0 & \Omega_i \end{bmatrix}$$

■ ESKF观测方程

$$y = h(x_t) + v \qquad v \sim N\{0, V\}$$

$$\begin{cases} K = PH^{T}(HPH^{T} + V)^{-1} \\ \delta x \leftarrow K\left(y - h\left(x_{t}^{\wedge}\right)\right) \\ P \leftarrow P - K(HPH^{T} + V)K^{T} \end{cases}$$

$$R = \begin{bmatrix} q_w^2 + q_x^2 - q_y^2 - q_z^2 & 2(q_x q_y - q_w q_z) & 2(q_x q_z + q_w q_y) \\ 2(q_x q_y + q_w q_z) & q_w^2 - q_x^2 + q_y^2 - q_z^2 & 2(q_y q_z - q_w q_x) \\ 2(q_x q_z - q_w q_y) & 2(q_y q_z + q_w q_x) & q_w^2 - q_x^2 - q_y^2 + q_z^2 \end{bmatrix}$$

将加速度计的三个测量作为观测变量:

$$\Rightarrow a_m = R^T \cdot \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$

■ ESKF观测方程

$$H \triangleq \frac{\partial h}{\partial \delta x}|_{x} = \frac{\partial h}{\partial x_{t}}|_{x} \frac{\partial x_{t}}{\partial \delta x}|_{x} = H_{x}X_{\delta x}$$

其中:

$$H_{x} = \begin{bmatrix} -2q_{y} & 2q_{z} & -2q_{w} & 2q_{x} & 0 & 0 & 0 \\ 2q_{x} & 2q_{w} & 2q_{z} & 2q_{y} & 0 & 0 & 0 \\ 2q_{w} & -2q_{x} & -2q_{y} & 2q_{z} & 0 & 0 & 0 \end{bmatrix}$$

$$X_{\delta x} \triangleq \frac{\partial x_t}{\partial \delta x}|_{x} = \begin{bmatrix} Q_{\delta \theta} & 0\\ 0 & I_3 \end{bmatrix}$$

其中:

$$Q_{\delta\theta} \triangleq \frac{\partial (q \otimes \delta q)}{\partial \delta \theta}|_{q} = \frac{\partial (q \otimes \delta q)}{\partial \delta q}|_{q} \frac{\partial \delta q}{\partial \delta \theta}|_{\delta\theta=0} = \frac{\partial ([q]_{L}\delta q)}{\partial \delta q}|_{q} \frac{\partial \left[\frac{1}{2}\delta\theta\right]}{\partial \delta \theta}|_{\delta\theta=0} = [q]_{L} \frac{1}{2} \begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$Q_{\delta\theta} = \frac{1}{2} \begin{bmatrix} -q_x & -q_y & -q_z \\ q_w & -q_z & q_y \\ q_z & q_w & -q_x \\ -q_y & q_x & q_w \end{bmatrix}$$

■ 添加error -state状态到nominal-state

$$x \leftarrow x \oplus \mathring{\delta x} \implies \begin{cases} q \leftarrow q \otimes q \{ \mathring{\delta \theta} \} \\ w_b \leftarrow w_b + \delta \mathring{w_b} \end{cases}$$

■ 复位error -state

$$\delta x \leftarrow g(\delta x) = \delta x \ominus \delta x$$

$$\begin{bmatrix} \delta x \leftarrow 0 \\ P \leftarrow GPG^T \end{bmatrix}$$

$$G \triangleq \frac{\partial g}{\partial \delta x} \Big|_{\delta x} = \begin{bmatrix} I - \begin{bmatrix} \frac{1}{2} \delta \theta \\ 0 \end{bmatrix} & 0 \\ 0 & I_3 \end{bmatrix}$$
